

# Don't Hyper-Ventilate over Hyper-V backup!

A straightforward solution to Hyper-V backup

Presented by Linus Chang, Lead Developer of BackupAssist

The theme of today is...

# Hyper-V!

# Today's agenda

1. The causes of discomfort and concern
2. Solving the difficulty problem
3. Solving the price problem
4. What else can BackupAssist do?

# The causes of discomfort and concern

Quick recap of the causes of Hyper-V hyperventilation:

## 1 **Difficulty = stress = nervous breakdown**

Traditional backup methods don't hit the spot!

Not straightforward to image guests: no USB pass through

How to back up multiple machines?

## 2 **Price gives your client a heart attack**

Install a license on each guest machine?

Install an expensive "special version" or "agent" to allow unlimited guest backups?

# Solving the difficulty problem

## The difficulty problems

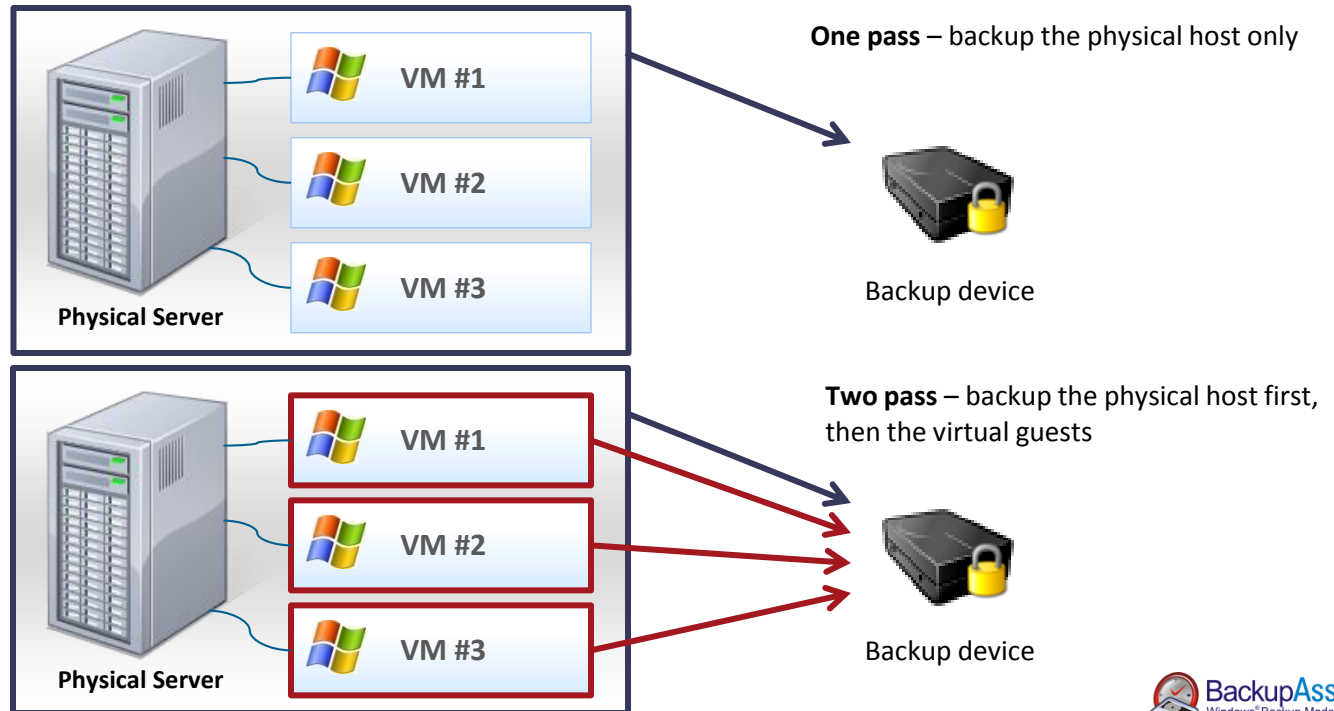

Recovery scenarios with a normal server

Recovery scenarios with a hyper-v server

BackupAssist handles all recovery scenarios

The difficulty problems:

- Recovery scenarios
- Installation – on host or guest or both?
- One-pass or two-pass backup?

# Solving the difficulty problem

The problems

Recovery scenarios  
with a normal server

Recovery scenarios  
with a hyper-v server

BackupAssist handles  
all recovery scenarios

Recovery scenarios with a normal server:

- Recover the entire server from bare metal
- Recover specific files and folders
- Recover a complete Exchange Server
- Recover individual Exchange mailboxes and Outlook items
- Recover SQL Server databases
- Onsite & offsite data protection

# Solving the difficulty problem

The problems

Recovery scenarios  
with a normal server

Recovery scenarios  
with a hyper-v server

BackupAssist handles  
all recovery scenarios

Recovery scenarios with a Hyper-v server:

- Recover the entire server from bare metal
- Recover specific files and folders
- Restore all Hyper-V VMs to a different host**
- Restore a single VM**
- Restore a single VM to a different host**
- Restore specific files & applications on a guest**
- Recover a complete Exchange Server
- Recover individual Exchange mailboxes and Outlook items
- Recover SQL Server databases
- Onsite & offsite data protection

# Solving the difficulty problem

## The problems

Recovery scenarios  
with a normal server

Recovery scenarios  
with a hyper-v server

BackupAssist handles  
all recovery scenarios

BackupAssist handles all recovery scenarios:

- ✓ Recover the entire server from bare metal
- ✓ Recover specific files and folders
- ✓ Restore all Hyper-V VMs to a different host
- ✓ Restore a single VM
- ✓ Restore a single VM to a different host
- ✓ Restore specific files & applications on a guest
- ✓ Recover a complete Exchange Server
- ✓ Recover individual Exchange mailboxes and Outlook items
- ✓ Recover SQL Server databases
- ✓ Onsite & offsite data protection

# How the BackupAssist solution works

## One-pass backup solution

## Hyper-V backup integration services

Let's clear up some terminology

Example setup

A one-pass backup solution that allows recovery at all levels.

One-pass means you don't need to back up the same data multiple times at both the host and guest levels.

### Utilises these features of Windows:

- Windows Server Backup (wbadmin) to image the host.
- Hyper-V Backup Integration Services – a VSS based snapshot of all guests.

### Additionally, BackupAssist provides:

- Hyper-V Granular Restore Console – to restore files and folders within Guest VMs.

### Plus, you get the world-famous benefits of BackupAssist:

- Scheduling
- Media Rotation
- Reminder Emails
- Report Emails

# How the BackupAssist solution works

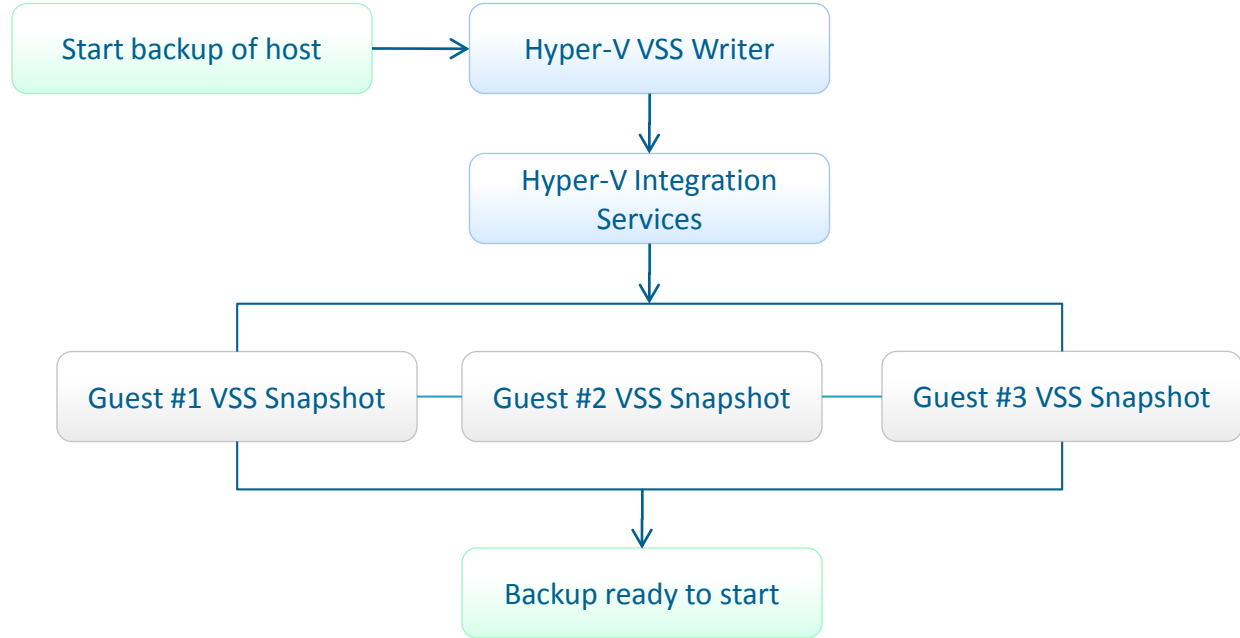

One-pass backup solution

Hyper-V backup integration services

Let's clear up some terminology

Example setup

Hyper-V backup integration services:

That way all the guests and the host are ready for backup.

- Guest must be an OS that supports VSS
- Use only basic disks, not dynamic disks

# How the BackupAssist solution works

One-pass backup solution

Hyper-V backup integration services

Let's clear up some terminology

Example setup

Clearing up some terminology:

**Hyper-V Snapshot** – is a manual snapshot created by the user, to allow you to roll back the entire machine to a past point in time.

- ❑ Not VSS Aware and not a backup!
- ❑ Only recommended for special occasions – e.g. before a risky operation like attempting an application upgrade, etc.
- ❑ Freezes a VHD file, and creates a differencing VHD (AVHD) on top of the VHD.
- ❑ Makes it more tedious to migrate from one host to another (but we have instructions on how to do this).
- ❑ Major impact on performance.
- ❑ Not recommended to leave snapshots hanging around! Remove when you've satisfied yourself that it's no longer needed.

**VSS Snapshot** – is a live snapshot created at backup time that makes sure all data is flushed to disk (for database integrity) and ready for backup.

- ❑ Exchange logs in guest machines are pruned.
- ❑ Slight performance hit as all guests commit their data to disk.
- ❑ All backup apps that use the Hyper-V VSS writer will suffer from this (not just BackupAssist).

**Fine print:**

Guest OS must use NTFS disks, formatted as Basic disks (not dynamic disks).

Each volume on each Guest OS must have adequate free space to store VSS data (20% rule of thumb).

After recovery, you need to manually recreate any virtual networks.

# How the BackupAssist solution works

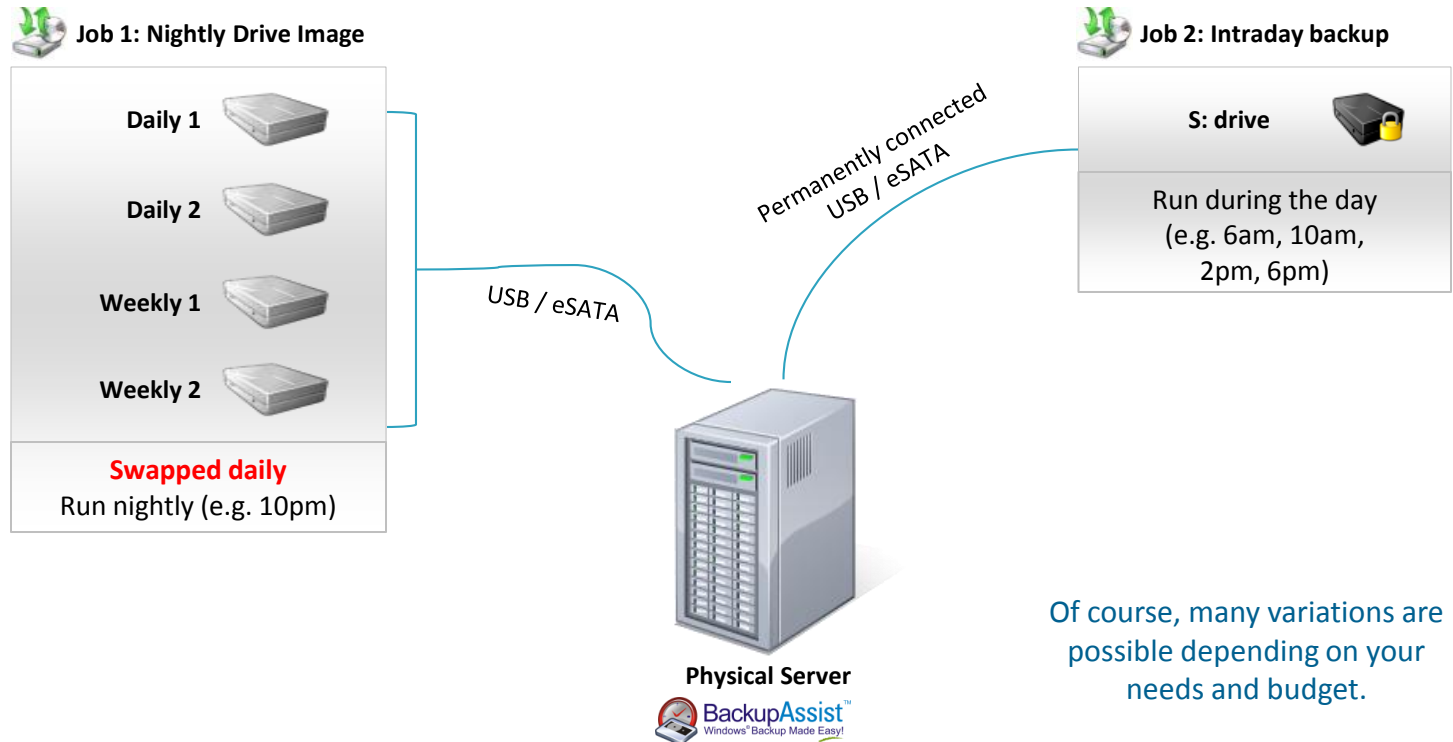

One-pass backup solution

Hyper-V backup integration services

Let's clear up some terminology

Example setup

Example of Hyper-V backup setup:

Of course, many variations are possible depending on your needs and budget.

# Recovery scenarios

Recover the entire server from bare metal

Recover specific files and folders

Restore all Hyper-V VMs to the same host

Restore a single VM

Restore a single VM to a different host

Restore specific files & applications on a guest

Recover a complete Exchange Server on Guest

Recover individual Exchange mailboxes and Outlook items

Recover SQL Server databases

Recover the entire server from bare metal.

1. Boot from the Windows DVD.
2. Launch the recovery.
3. Load any new drivers for the new hardware.
4. Make yourself a coffee and come back later.

For additional information, please see:

**Testing Report: Simulated disaster recovery of a Hyper-V host and all Guest VMs to new hardware:**

[http://www.backupassist.com/downloads/casestudies/Hyper-V\\_BareMetalRestore.pdf](http://www.backupassist.com/downloads/casestudies/Hyper-V_BareMetalRestore.pdf)

# Recovery scenarios

Recover the entire server from bare metal

Recover specific files and folders

Restore all Hyper-V VMs to the same host

Restore a single VM

Restore a single VM to a different host

Restore specific files & applications on a guest

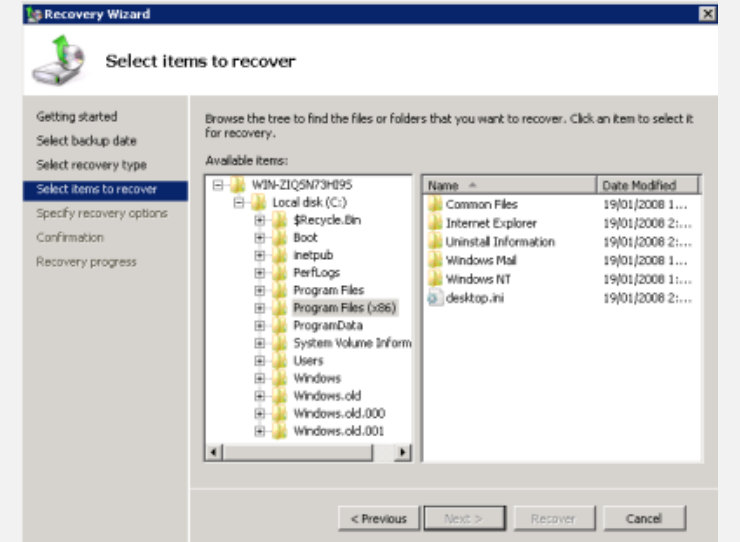

Recover a complete Exchange Server on Guest

Recover individual Exchange mailboxes and Outlook items

Recover SQL Server databases

Recover specific files and folders.

1. Launch the Windows Server Backup Recovery Wizard.
2. Choose your backup and select the 'Files and folders' option.
3. Select what you want to restore.
4. Complete the wizard.

For additional information, please see:

**HOWTO: File and Application Restoration from Windows Server 2008 Backup**

<http://www.wbadmin.info/articles/howto-file-application-restoration-windows-server-2008.html>

# Recovery scenarios

Recover the entire server from bare metal

Recover specific files and folders

Restore all Hyper-V VMs to the same host

Restore a single VM

Restore a single VM to a different host

Restore specific files & applications on a guest

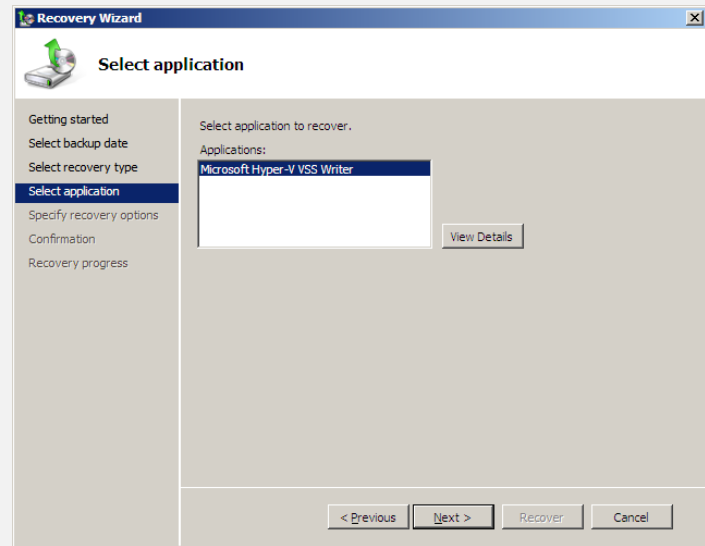

Recover a complete Exchange Server on Guest

Recover individual Exchange mailboxes and Outlook items

Recover SQL Server databases

## Restore all Hyper-V VMs to the same host

1. Launch the Windows Server Backup Recovery Wizard.
2. Choose your backup and select the 'Applications' option.
3. Select the option for Hyper-V VSS Writer.
4. Complete the wizard.

For additional information, please see:

### HOWTO: File and Application Restoration from Windows Server 2008 Backup

<http://www.wbadmin.info/articles/howto-file-application-restoration-windows-server-2008.html>

# Recovery scenarios

Recover the entire server from bare metal

Recover specific files and folders

Restore all Hyper-V VMs to the same host

## Restore a single VM

Restore a single VM to a different host

Restore specific files & applications on a guest

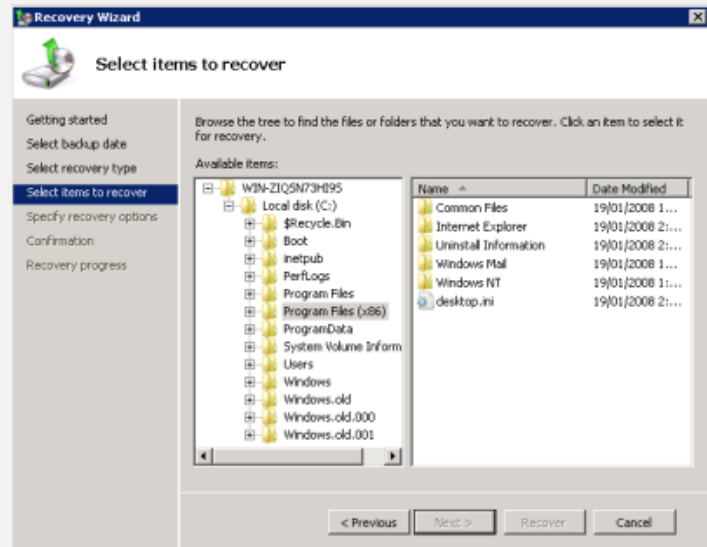

Recover a complete Exchange Server on Guest

Recover individual Exchange mailboxes and Outlook items

Recover SQL Server databases

## Restore a single VM

1. Launch the Windows Server Backup Recovery Wizard.
2. Choose your backup and select the 'Files and folders' option.
3. Stop the Hyper-V Guest.
4. Select what you want to restore.
5. Complete the wizard.

For additional information, please see:

### Individual VM Restore of Hyper-V machine from backup

<http://www.backupassist.com/blog/support/granular-individual-vm-restore-of-hyper-v-virtual-machine-from-backup/>

# Recovery scenarios

Recover the entire server from bare metal

Recover specific files and folders

Restore all Hyper-V VMs to the same host

Restore a single VM

**Restore a single VM to a different host**

Restore specific files & applications on a guest

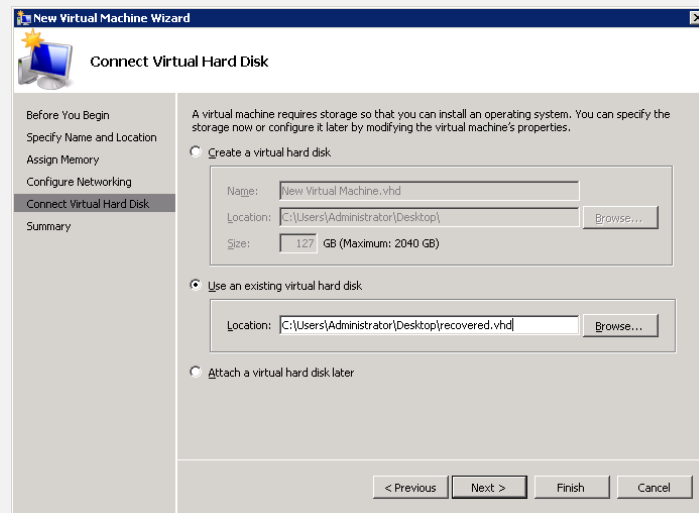

Recover a complete Exchange Server on Guest

Recover individual Exchange mailboxes and Outlook items

Recover SQL Server databases

## Restore a single VM to a different host

1. Launch the Window Server Backup Recovery Wizard and choose to recover another server.
2. Select your backup location and the backup you wish to recover.
3. Choose to restore files and folders, locate the VM's VHD file and restore it to a local volume.
4. Open the Hyper-V manager, create new virtual machine and attach your recovered VHD file.
5. Complete the wizard and start your recovered VM.

For additional information, please see:

### Individual VM Restore of Hyper-V machine from backup

<http://www.backupassist.com/blog/support/granular-individual-vm-restore-of-hyper-v-virtual-machine-from-backup/>

# Recovery scenarios

Recover the entire server from bare metal

Recover specific files and folders

Restore all Hyper-V VMs to the same host

Restore a single VM

Restore a single VM to a different host

Restore specific files & applications on a guest

Recover a complete Exchange Server on Guest

Recover individual Exchange mailboxes and Outlook items

Recover SQL Server databases

## Restore specific files and applications on a guest

1. Launch the BackupAssist Hyper-V Granular Restore Console.
2. Connect your backup device, and select the backup to restore from.
3. Mount the Guest's VHD as a drive letter on the host.
4. Copy over the data you want to restore.
5. Unmount the VHD from the host.

For additional information, please watch:

**Hyper-V Granular Restore Console Video Demonstration**

# Recovery scenarios

Recover the entire server from bare metal

Recover specific files and folders

Restore all Hyper-V VMs to the same host

Restore a single VM

Restore a single VM to a different host

Restore specific files & applications on a guest

Recover a complete Exchange Server on a Guest

Recover individual Exchange mailboxes and Outlook items

Recover SQL Server databases

## Restore specific files and applications on a guest

1. Use the BackupAssist Hyper-V Granular Restore Console to mount your backup.
2. Stop Exchange Server on your guest.
3. Rename your existing Mailbox folder (“just in case”) and create a new Mailbox folder.
4. Copy the Exchange Mailbox folder from the mounted backup (from step 1).
5. Start Exchange Server on your guest.
6. Unmount the VHD from the host.

For additional information, please watch:

**Hyper-V Granular Restore Console Video Demonstration**

# Recovery scenarios

Recover the entire server from bare metal

Recover specific files and folders

Restore all Hyper-V VMs to the same host

Restore a single VM

Restore a single VM to a different host

Restore specific files & applications on a guest

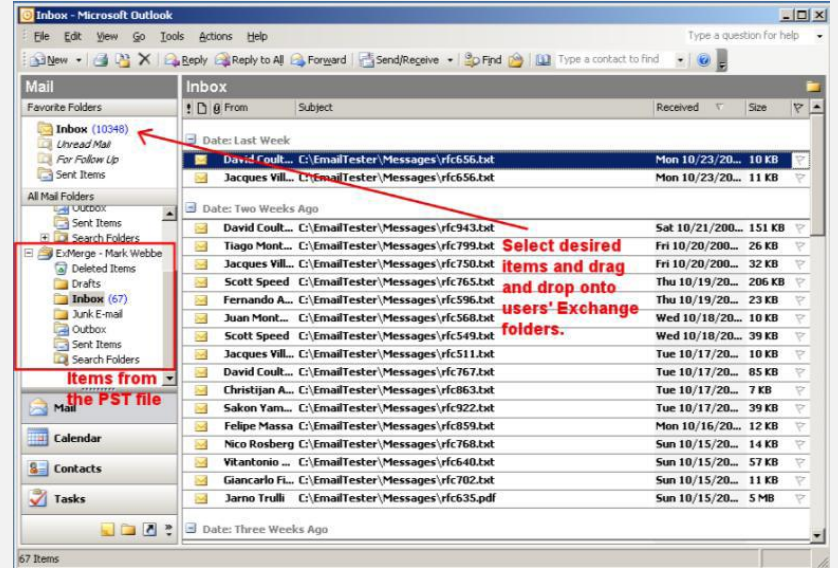

Recover a complete Exchange Server on a Guest

Recover individual Exchange mailboxes and Outlook items

Recover SQL Server databases

## Recover individual Exchange mailboxes and Outlook items

1. Copy the appropriate PST file to a location that is accessible to the relevant user's computer. (e.g. "Users Shared Folders", another network share or an external hard drive).
2. From the relevant user's computer, run Microsoft Outlook and select File > Open > Outlook Data File.
3. Browse for the PST file in the location it was copied to in Step 1.
4. From this PST file you can view the email messages and drag-and-drop the mail items back into the original folders.

For additional information, please see:

# Recovery scenarios

Recover the entire server from bare metal

Recover specific files and folders

Restore all Hyper-V VMs to the same host

Restore a single VM

Restore a single VM to a different host

Restore specific files & applications on a guest

Recover a complete Exchange Server on a Guest

Recover individual Exchange mailboxes and Outlook items

Recover SQL Server databases

## Recover SQL Server databases (backed up by the BackupAssist SQL Add-on)

1. Launch the BackupAssist SQL Restore utility.
2. Choose the SQL server instance you wish to restore to.
3. Specify the path where the database backup files reside (in .BAK format).
4. Select which database backups you want to restore from the list.
5. Specify the point in time that you want to restore your databases to (a different restore time can be specified for each individual database if required).
6. Click Start restore to restore your SQL databases.

Select a restore time for all databases:

# What else can BackupAssist do?

Probably the most  
versatile backup  
package

One-stop solution that  
satisfies your clients

No more  
hyperventilation for  
any kind of backup!

Since our last appearance at SMB Nation in 2008:

- ✓ To be released shortly: Hyper-V Granular Restore Console
- ✓ Released in v5.3: Tape Drive Support for Windows Server 2008 – ZIP Engine
- ✓ Released in v5.3: Exchange Mailbox Support for Exchange Server 2007
- ✓ Released in v5.2: Exchange Server 2007 backup on Server 2008 (Exchange plug-in)
- ✓ Released in v5.1: Rsync – Bandwidth efficient Internet based backup
- ✓ Released in v5.0: File Replication Engine – exact mirroring of file systems
- ✓ Released in v5.0: Centralized Monitoring Console

# What else can BackupAssist do?

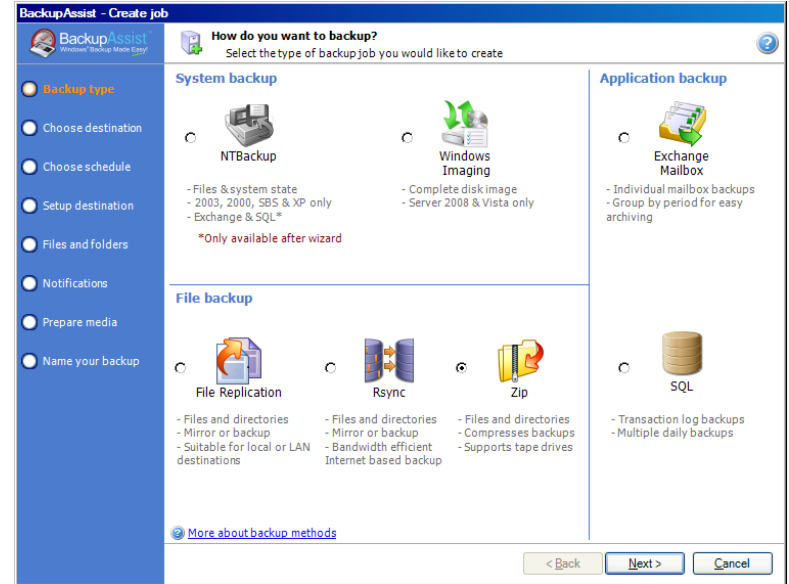

Probably the most versatile backup package

One-stop solution that satisfies your clients

No more hyperventilation for any kind of backup!

Probably the most versatile backup package:

- ✓ Drive Imaging on Server 2008
- ✓ Data Backup with our new ZIP Engine:
  - 📀 Tape
  - 💾 External / Local Disk
  - 🌐 NAS
  - 🗑️ USB Flash
  - 💿 DVD
- ✓ Bandwidth efficient Internet based backup
- ✓ Centralized Monitoring
- ✓ Fix Windows Server Backup problems
- ✓ Fix NTBackup problems
